

Stainless Steel Balustrade Systems

Again there is a large range of options, with the stainless steel balustrade system that we can supply and install, all comprising of 316 grade products and either 300 grit or mirror polished finishes. The posts and top rails used are typically 50mm round. A timber top rail can be fitted, in place of stainless if desired. The infill material in this system, can be either stainless steel wires (horizontally or vertically), toughened glass or round rod. This system is also ideal for pool fencing, and can be installed without a top rail, in this instance.

Swaged fittings for the termination of the stainless steel wire, are available in a variety of styles. In situations where a combination of timber post / top rail balustrading (installed by others) is combined with stainless steel wires, we can supply and install the stainless steel wire component of the handrail, with our hydraulic swaging equipment, which can be brought to site if required.
